Chapter 1

Signatures

Decisively Smash The Formalist Clique!

Chairman Jon

A *signature* is a collection of definitions, including terms, tactics and theorems.

1.1 Grammar

The grammar of RedPRL signatures is presented in Figure 1.1. Note that an optional production of sort s is formatted $\langle s \rangle$ in the rules.

1.2 Elaboration Semantics

The static semantics for RedPRL signatures begins with a specification of the class of *semantic* objects that will serve as the meanings for the *syntactic* objects defined in Section 1.1. We assume an ambient abstract binding tree signature such that at least the following facts hold:

Then, our semantic objects are defined as in Figure 1.2.

A *natural semantics* hinges on the elaboration judgment $E \vdash A \Longrightarrow A'$, which means that the syntactic object A elaborates to the semantic object A' in the environment E. Let the $\Upsilon_{\Sigma} \in \text{Params}$ be defined as follows:

$$\Upsilon_{\Sigma}(u) \triangleq \left\{ egin{array}{ll} ext{opid} & ext{ if } u \equiv \vartheta \in \mathbf{dom}(\Sigma) \ au & ext{ if } \Sigma(u) \equiv au \ ot & ext{ otherwise} \end{array}
ight.$$

(1.20)

Chapter 2

The Refinement Logic

2.1 Forms of Judgment

2.1.1 Hypothesis Contexts

First, we develop the syntax of hypothesis contexts with respect to a metavariable context Θ *mctx* and a symbol context Υ *sctx*:

$$\frac{\Theta \triangleright \Upsilon \parallel H \ hypctx}{\Theta \triangleright \Upsilon \parallel \cdot hypctx} \qquad \frac{\Theta \triangleright \Upsilon \parallel H \ hypctx}{\Theta \triangleright \Upsilon \parallel |H| \vdash A : \exp} \qquad x \notin H$$

The *domain* |H| *vctx* of a hypothesis context $\Theta \triangleright \Upsilon \parallel H$ *hypotx* is defined as follows:

$$\left| \cdot \right| \triangleq \cdot$$

$$\left| H, x :_{\tau} A \right| \triangleq \left| H \right|, x : \tau$$

2.1.2 Hypothetico-General Sequents

RedPRL's refinement logic is organized around several forms of *sequent*, which are schematized as follows, depending on the form of conclusion:

$$H \gg_{\Theta}^{\Upsilon} conclusion \leadsto synthesis$$
 (Sequent)

We also use a *generic sequent* which closes over variables in Γ :

$$[\Gamma] \mid H \gg_{\Theta}^{\Upsilon} conclusion \leadsto synthesis$$
 (Generic Sequent)

Forms of Conclusion

The form of synthesis depends on the particular form of conclusion (categorical judgment); we formalize this with the $\Theta \triangleright \Upsilon \parallel \Gamma \vdash \lfloor C \rfloor \ concl \leadsto \tau$ judgment form, defined as follows:

$$\frac{\Theta \triangleright \Upsilon \parallel \Gamma \vdash A : \exp}{\Theta \triangleright \Upsilon \parallel \Gamma \vdash \lfloor A \ true_{\tau} \rfloor \ concl \leadsto \tau} \text{ Truth}$$

$$\frac{\Theta \triangleright \Upsilon \parallel \Gamma \vdash M : \tau}{\Theta \triangleright \Upsilon \parallel \Gamma \vdash N : \tau} \quad \Theta \triangleright \Upsilon \parallel \Gamma \vdash A : \exp}{\Theta \triangleright \Upsilon \parallel \Gamma \vdash LM = N \in_{\tau} A \rfloor \ concl \leadsto \exp} \text{ Equality}$$

```
\frac{\Theta \triangleright \Upsilon \parallel \Gamma \vdash M : \tau \quad \Theta \triangleright \Upsilon \parallel \Gamma \vdash A : \exp}{\Theta \triangleright \Upsilon \parallel \Gamma \vdash [M \in_{\tau} A] \ concl} \  \  \, \stackrel{\text{denomination}}{\to \exp} \  \  \, \text{Membership} \frac{\Theta \triangleright \Upsilon \parallel \Gamma \vdash R : \tau \quad \Theta \triangleright \Upsilon \parallel \Gamma \vdash A : \exp}{\Theta \triangleright \Upsilon \parallel \Gamma \vdash [R \ synth_{\tau}] \ concl} \  \  \, \stackrel{\text{denomination}}{\to \exp} \  \  \, \text{Membership Synthesis} \frac{\Theta \triangleright \Upsilon \parallel \Gamma \vdash R : \tau}{\Theta \triangleright \Upsilon \parallel \Gamma \vdash S : \tau} \quad \Theta \triangleright \Upsilon \parallel \Gamma \vdash A : \exp}{\Theta \triangleright \Upsilon \parallel \Gamma \vdash [R = S \ synth_{\tau}] \ concl} \  \  \, \stackrel{\text{denomination}}{\to \exp} \  \  \, \text{Equality Synthesis} \frac{\Theta \triangleright \Upsilon \parallel \Gamma \vdash [R = S \ synth_{\tau}] \ concl}{\Theta \triangleright \Upsilon \parallel \Gamma \vdash [A \ type] \ concl} \  \  \, \stackrel{\text{denomination}}{\to \operatorname{denomination}} \  \  \, \text{Level Synthesis}
```

Syntax of Sequents

Now that we have enumerated the forms of conclusion, we can precisely give the syntax of the sequent judgment. We will say that the sequent $H \gg_{\Theta}^{\Upsilon} C \rightsquigarrow S$ is a meaningful judgment in case the following presuppositions obtain:

```
    Θ mctx
    Υ sctx
    Θ ▷ Υ || H hypctx
    Θ ▷ Υ || |H| ⊢ [C] concl → τ
    Θ ▷ Υ || |H| ⊢ S : τ
```

The meaning of the sequent judgment is given inductively by a collection of formal rules, which are then related to the *intended semantics* of Nominal Computational Type Theory by a soundness theorem.

Syntax of Generic Sequents

The generic sequent $[\Gamma] \mid H \gg_{\Theta}^{\Upsilon} C \rightsquigarrow E$ is presupposes the following:

```
1. \Theta mctx
2. \Upsilon sctx
3. \Theta \rhd \Upsilon \parallel H hypctx
4. \Gamma vctx and \Gamma \subseteq |H|
5. \Theta \rhd \Upsilon \parallel |H| \vdash [C] concl \leadsto \tau
6. \Theta \rhd \Upsilon \parallel |H| \setminus \Gamma \vdash E : [\Gamma] \cdot \tau
```

Notice that the synthesis of a *generic* sequent is always an *abstraction* / binder, which allows a rule to single out some portion Γ of the hypothetical context H for later substitution. This provides a hygienic way to to express refinement rules which introduce a new hypothesis, such as the introduction rule for functions. More generally, the binding of variables in the synthesis to a judgment is an essential part of the Dependent LCF apparatus.

2.2 Selected Rules

The *generic sequent* is introduced as follows, by closing synthesis of the corresponding regular sequent in an abstraction of the variables in Γ .

$$\frac{H \gg_{\Theta}^{\Upsilon} C \leadsto S}{[\Gamma] \mid H \gg_{\Theta}^{\Upsilon} C \leadsto [\overrightarrow{x}]. \ [\overrightarrow{x} \ / \ \Gamma] S}$$

Membership in checking-mode is defined in terms of equality.

$$\frac{H \gg_{\Theta}^{\Upsilon} M = M \in_{\tau} A \leadsto \mathbf{Ax}}{H \gg_{\Theta}^{\Upsilon} M \in_{\tau} A \leadsto \mathbf{Ax}}$$

Dually, equality synthesis is defined in terms of membership synthesis.

$$\begin{array}{cccc} H \gg_{\Theta}^{\Upsilon} R \ synth_{\tau} \leadsto A_{1} & H \gg_{\Theta}^{\Upsilon} A_{1} \ synth \leadsto \mathbb{U}_{i} \\ H \gg_{\Theta}^{\Upsilon} S \ synth_{\tau} \leadsto A_{2} & H \gg_{\Theta}^{\Upsilon} A_{1} = A_{2} \in_{\exp} \mathbb{U}_{i} \leadsto \mathsf{Ax} \\ \hline & H \gg_{\Theta}^{\Upsilon} R = S \ synth_{\tau} \leadsto A_{1} \end{array}$$
